frames, skin planking, or ceiling are of unusual thickness the breadth of vessel to inside girding should be reported if possible. The height of the R. Q. D. is to be taken from the level of the top of the amidship beam. In vessels having total standard mean sheer means the sheer measured at the stem and stern in vessels having poops and forecastles, it means the sheer measured at points distant 1/4th of the vessel's length from stem and stern-post.

State dimensions of freeing port used on back of this form.
The Surveyor should state whether the fall in sheer as reported is measured relatively to the straight line of keel or to the water line. If measured relatively to water line the vessel's draft at time of survey, and also the usual load draft forward and aft should be reported.
