

Can Arguehart-

Lark. 22537.

It is noted that the two W.T. boilers have been constructed for a working pressure of 240 lb. per sq. inch with a corresponding pressure at the superheaters of 230 lb., while the cylindrical boiler has been approved for 220 lb.

It is concluded therefore that the safety valves on the steam drum of the W.T. boilers have been adjusted to 230 lb. and those on the superheaters to 220 lb., but it is submitted that be confirmed.
